# Non-Inertial Frames in Special Relativity 

A. Blato<br>Creative Commons Attribution 3.0 License<br>(2018) Buenos Aires<br>Argentina

This article presents a reformulation of special relativity which is invariant under transformations between inertial and non-inertial * frames and which can be applied in any frame without introducing fictitious forces. A simple solution to the twin paradox is presented and a new universal force is proposed too. * Uniform Circular Motion (UCM)

## Introduction

The intrinsic mass $(m)$ and the frequency factor $(f)$ of a massive particle are given by:

$$
\begin{aligned}
& m \doteq m_{o} \\
& f \doteq\left(1-\frac{\mathbf{v} \cdot \mathbf{v}}{c^{2}}\right)^{-1 / 2}
\end{aligned}
$$

where $\left(m_{o}\right)$ is the rest mass of the massive particle, $(\mathbf{v})$ is the relational velocity of the massive particle and $(c)$ is the speed of light in vacuum.

The intrinsic mass $(m)$ and the frequency factor $(f)$ of a non-massive particle are given by:

$$
\begin{aligned}
m & \doteq \frac{h \kappa}{c^{2}} \\
f & \doteq \frac{\nu}{\kappa}
\end{aligned}
$$

where $(h)$ is the Planck constant, ( $\nu)$ is the relational frequency of the non-massive particle, $(\kappa)$ is a positive universal constant with dimension of frequency and $(c)$ is the speed of light in vacuum.

In this article, a massive particle is a particle with non-zero rest mass and a non-massive particle is a particle with zero rest mass.

## The Invariant Kinematics

The special position ( $\overline{\mathbf{r}}$ ), the special velocity $(\overline{\mathbf{v}})$ and the special acceleration ( $\overline{\mathbf{a}}$ ) of a ( massive or non-massive ) particle are given by:

$$
\begin{aligned}
& \overline{\mathbf{r}} \doteq \int f \mathbf{v} d t \\
& \overline{\mathbf{v}} \doteq \frac{d \overline{\mathbf{r}}}{d t}=f \mathbf{v} \\
& \overline{\mathbf{a}} \doteq \frac{d \overline{\mathbf{v}}}{d t}=f \frac{d \mathbf{v}}{d t}+\frac{d f}{d t} \mathbf{v}
\end{aligned}
$$

where $(f)$ is the frequency factor of the particle, $(\mathbf{v})$ is the relational velocity of the particle and $(t)$ is the relational time of the particle.

## The Invariant Dynamics

If we consider a ( massive or non-massive ) particle with intrinsic mass ( $m$ ) then the linear momentum $(\mathbf{P})$ of the particle, the angular momentum $(\mathbf{L})$ of the particle, the net force ( $\mathbf{F}$ ) acting on the particle, the work ( W ) done by the net force acting on the particle, and the kinetic energy ( K ) of the particle are given by:

$$
\begin{aligned}
& \mathbf{P} \doteq m \overline{\mathbf{v}}=m f \mathbf{v} \\
& \mathbf{L} \doteq \mathbf{P} \dot{\times} \mathbf{r}=m \overline{\mathbf{v}} \dot{\times} \mathbf{r}=m f \mathbf{v} \dot{\times} \mathbf{r} \\
& \mathbf{F}=\frac{d \mathbf{P}}{d t}=m \overline{\mathbf{a}}=m\left[f \frac{d \mathbf{v}}{d t}+\frac{d f}{d t} \mathbf{v}\right] \\
& \mathrm{W} \doteq \int_{1}^{2} \mathbf{F} \cdot d \mathbf{r}=\int_{1}^{2} \frac{d \mathbf{P}}{d t} \cdot d \mathbf{r}=\Delta \mathrm{K} \\
& \mathrm{~K} \doteq m f c^{2}
\end{aligned}
$$

where ( $f, \mathbf{r}, \mathbf{v}, t, \overline{\mathbf{v}}, \overline{\mathbf{a}})$ are the frequency factor, the relational position, the relational velocity, the relational time, the special velocity and the special acceleration of the particle and $(c)$ is the speed of light in vacuum. The kinetic energy $\left(\mathrm{K}_{o}\right)$ of a massive particle at relational rest is $\left(m_{o} c^{2}\right)$

## Relational Quantities

From an auxiliary massive particle ( called auxiliary-point ) some kinematic quantities ( called relational quantities ) can be obtained. These are invariant under transformations between inertial and non-inertial (UCM) frames.

An auxiliary-point is an arbitrary massive particle free of external forces ( or that the net force acting on it is zero )

The relational time $(t)$, the relational position $(\mathbf{r})$, the relational velocity ( $\mathbf{v}$ ) and the relational acceleration ( $\mathbf{a}$ ) of a (massive or non-massive) particle relative to an inertial or non-inertial (UCM) frame $S$ are given by:

$$
\begin{aligned}
& t \doteq \gamma\left(\mathrm{t}-\frac{\vec{r} \cdot \vec{\varphi}}{c^{2}}\right) \\
& \mathbf{r} \doteq \vec{r}+\frac{\gamma^{2}}{\gamma+1} \frac{(\vec{r} \cdot \vec{\varphi}) \vec{\varphi}}{c^{2}}-\gamma \vec{\mu}-\frac{\gamma^{2}}{\gamma+1} \frac{(\vec{\mu} \times \vec{\varphi}) \times \vec{\varphi}}{c^{2}} \\
& \mathbf{v} \doteq \frac{d \mathbf{r}}{d t}=\frac{d \mathbf{r}}{d t} \frac{\mathrm{dt}}{\mathrm{dt}}=\frac{d \mathbf{r}}{\mathrm{dt}} \frac{\mathrm{dt}}{d t}=\left(\frac{d \mathbf{r}}{\mathrm{dt}}\right)\left(\frac{1}{d t / \mathrm{dt}}\right) \\
& \mathbf{a} \doteq \frac{d \mathbf{v}}{d t}=\frac{d \mathbf{v}}{d t} \frac{\mathrm{dt}}{\mathrm{dt}}=\frac{d \mathbf{v}}{\mathrm{dt}} \frac{\mathrm{dt}}{d t}=\left(\frac{d \mathbf{v}}{\mathrm{dt}}\right)\left(\frac{1}{d t / \mathrm{dt}}\right)
\end{aligned}
$$

where $(\mathrm{t}, \vec{r})$ are the time and the position of the particle relative to the frame S , $(\vec{\varphi}, \vec{\mu})$ are the velocity and the position of the auxiliary-point relative to the frame $S$ and $(c)$ is the speed of light in vacuum. $(\vec{\varphi})$ is a constant in inertial frames. $(\gamma)$ is a constant in non-inertial (UCM) frames. $\gamma=\left(1-\vec{\varphi} \cdot \vec{\varphi} / c^{2}\right)^{-1 / 2}$

The relational frequency $(\nu)$ of a non-massive particle relative to an inertial or non-inertial (UCM) frame $S$ is given by:

$$
\nu \doteq \mathrm{v} \frac{\left(1-\frac{\vec{c} \cdot \vec{\varphi}}{c^{2}}\right)}{\sqrt{1-\frac{\vec{\varphi} \cdot \vec{\varphi}}{c^{2}}}}
$$

where ( v ) is the frequency of the non-massive particle relative to the frame $S$, $(\vec{c})$ is the velocity of the non-massive particle relative to the frame $S,(\vec{\varphi})$ is the velocity of the auxiliary-point relative to the frame $S$ and $(c)$ is the speed of light in vacuum.
$\S$ In arbitrary frames $\left(t_{\alpha} \neq \tau_{\alpha}\right.$ or $\left.\mathbf{r}_{\alpha} \neq 0\right)(\alpha=$ auxiliary-point $)$ a constant must be add in the definition of relational time such that the relational time and the proper time of the auxiliary-point are the same ( $t_{\alpha}=\tau_{\alpha}$ ) and another constant must be add in the definition of relational position such that the relational position of the auxiliary-point is zero ( $\mathbf{r}_{\alpha}=0$ )
§ In the particular case of an isolated system of ( massive or non-massive ) particles, all observers should preferably use an auxiliary-point such that the linear momentum of the isolated system of particles is zero $\left(\sum_{z} m_{z} \overline{\mathbf{v}}_{z}=0\right)$
$\S$ In inertial frames the geometry is Euclidean and in non-inertial (UCM) frames the geometry is non-Euclidean ( the local geometry should be obtained from the auxiliary-point )

## General Observations

§ Forces and fields must be expressed with relational quantities ( the Lorentz force must be expressed with the relational velocity $\mathbf{v}$, the electric field must be expressed with the relational position $\mathbf{r}$, etc. )
$\S$ The operator $(\dot{x})$ must be replaced by the operator $(\times)$ or the operator $(\wedge)$ as follows: $(\mathbf{a} \dot{\times} \mathbf{b}=\mathbf{b} \times \mathbf{a})$ or $(\mathbf{a} \dot{\times} \mathbf{b}=\mathbf{b} \wedge \mathbf{a})$
§ The intrinsic mass quantity $(m)$ is invariant under transformations between inertial and non-inertial (all) frames.
$\S$ The relational quantities ( $\nu, t, \mathbf{r}, \mathbf{v}, \mathbf{a})$ are invariant under transformations between inertial and non-inertial (UCM) frames.
$\S$ Therefore, the kinematic and dynamic quantities $(f, \overline{\mathbf{r}}, \overline{\mathbf{v}}, \overline{\mathbf{a}}, \mathbf{P}, \mathbf{L}, \mathbf{F}, \mathrm{~W}, \mathrm{~K})$ are invariant under transformations between inertial and non-inertial (UCM) frames.
$\S$ However, it is natural to consider the following generalization:

- It would also be possible to obtain relational quantities ( $\nu, t, \mathbf{r}, \mathbf{v}, \mathbf{a})$ that would be invariant under transformations between inertial and non-inertial (all) frames.
- The kinematic and dynamic quantities ( $f, \overline{\mathbf{r}}, \overline{\mathbf{v}}, \overline{\mathbf{a}}, \mathbf{P}, \mathbf{L}, \mathbf{F}, \mathrm{~W}, \mathrm{~K})$ would also be given by the equations of this article.
- Therefore, the kinematic and dynamic quantities ( $f, \overline{\mathbf{r}}, \overline{\mathbf{v}}, \overline{\mathbf{a}}, \mathbf{P}, \mathbf{L}, \mathbf{F}, \mathrm{~W}, \mathrm{~K}$ ) would be invariant under transformations between inertial and non-inertial (all) frames.

## The Twin Paradox

Clock $A$ is at rest at the origin $O$ of an inertial or non-inertial (UCM) frame $S$

$$
\begin{aligned}
& t_{1 A}=\gamma_{(\vec{\varphi})}\left(\mathrm{t}_{1 A}-\frac{\vec{r}_{1 A} \cdot \vec{\varphi}}{c^{2}}\right) \\
& t_{2 A}=\gamma_{(\vec{\varphi})}\left(\mathrm{t}_{2 A}-\frac{\vec{r}_{2 A} \cdot \vec{\varphi}}{c^{2}}\right)
\end{aligned}
$$

Clock B is at rest at the origin O' of another non-inertial (UCM) frame S'

$$
\begin{aligned}
& t_{1 B}=\gamma_{\left(\vec{\varphi}^{\prime}\right)}\left(\mathrm{t}_{1 B}-\frac{\vec{r}_{1 B} \cdot \vec{\varphi}^{\prime}}{c^{2}}\right) \\
& t_{2 B}=\gamma_{\left(\vec{\varphi}^{\prime}\right)}\left(\mathrm{t}_{2 B}-\frac{\vec{r}_{2 B} \cdot \vec{\varphi}^{\prime}}{c^{2}}\right)
\end{aligned}
$$

The origin O relative to the frame S always equals zero $\left(\vec{r}_{1 A}=\vec{r}_{2 A}=0\right)$ then

$$
\begin{aligned}
& t_{2 A}-t_{1 A}=\gamma_{(\vec{\varphi})}\left(\mathrm{t}_{2 A}-\mathrm{t}_{1 A}\right) \\
& \Delta t_{A}=\gamma_{(\vec{\varphi})} \Delta \mathrm{t}_{A}
\end{aligned}
$$

The origin $\mathrm{O}^{\prime}$ relative to the frame $\mathrm{S}^{\prime}$ always equals zero $\left(\vec{r}_{1 B}=\vec{r}_{2 B}=0\right)$ then

$$
\begin{aligned}
& t_{2 B}-t_{1 B}=\gamma_{\left(\vec{\varphi}^{\prime}\right)}\left(\mathrm{t}_{2 B}-\mathrm{t}_{1 B}\right) \\
& \Delta t_{B}=\gamma_{\left(\vec{\varphi}^{\prime}\right)} \Delta \mathrm{t}_{B}
\end{aligned}
$$

The origins O and $\mathrm{O}^{\prime}$ spatially coincide at relational time ( $t_{1}=t_{1 A}=t_{1 B}$ ) and relational time ( $t_{2}=t_{2 A}=t_{2 B}$ ) Since ( $\Delta t_{A}=\Delta t_{B}$ ) then

$$
\gamma_{(\vec{\varphi})} \Delta \mathrm{t}_{A}=\gamma_{\left(\vec{\varphi}^{\prime}\right)} \Delta \mathrm{t}_{B}
$$

Therefore, if $\left(\vec{\varphi}>\vec{\varphi}^{\prime}\right)$ then $\left(\Delta \mathrm{t}_{A}<\Delta \mathrm{t}_{B}\right)$, if $\left(\vec{\varphi}=\vec{\varphi}^{\prime}\right)$ then $\left(\Delta \mathrm{t}_{A}=\Delta \mathrm{t}_{B}\right)$ and if $\left(\vec{\varphi}<\vec{\varphi}^{\prime}\right)$ then $\left(\Delta \mathrm{t}_{A}>\Delta \mathrm{t}_{B}\right)$

## The Kinetic Force

The kinetic force $\mathbf{K}_{i j}^{a}$ exerted on a particle $i$ with intrinsic mass $m_{i}$ by another particle $j$ with intrinsic mass $m_{j}$ is given by:

$$
\mathbf{K}_{i j}^{a}=-\left[\frac{m_{i} m_{j}}{\mathbb{M}}\left(\overline{\mathbf{a}}_{i}-\overline{\mathbf{a}}_{j}\right)\right]
$$

where $\overline{\mathbf{a}}_{i}$ is the special acceleration of particle $i, \overline{\mathbf{a}}_{j}$ is the special acceleration of particle $j$ and $\mathbb{M}\left(=\sum_{z} m_{z}\right)$ is the sum of the intrinsic masses of all the particles of the Universe.
The kinetic force $\mathbf{K}_{i}^{u}$ exerted on a particle $i$ with intrinsic mass $m_{i}$ by the Universe is given by:

$$
\mathbf{K}_{i}^{u}=-m_{i} \frac{\sum_{z} m_{z} \overline{\mathbf{a}}_{z}}{\sum_{z} m_{z}}
$$

where $m_{z}$ and $\overline{\mathbf{a}}_{z}$ are the intrinsic mass and the special acceleration of the $z$-th particle of the Universe.
From the above equations it follows that the net kinetic force $\mathbf{K}_{i}\left(=\sum_{j} \mathbf{K}_{i j}^{a}\right.$ $+\mathbf{K}_{i}^{u}$ ) acting on a particle $i$ with intrinsic mass $m_{i}$ is given by:

$$
\mathbf{K}_{i}=-m_{i} \overline{\mathbf{a}}_{i}
$$

where $\overline{\mathbf{a}}_{i}$ is the special acceleration of particle $i$.
Now, substituting ( $\mathbf{F}_{i}=m_{i} \overline{\mathbf{a}}_{i}$ ) and rearranging, we obtain:

$$
\mathbf{T}_{i} \doteq \mathbf{K}_{i}+\mathbf{F}_{i}=0
$$

Therefore, the total force $\mathbf{T}_{i}$ acting on a particle $i$ is always zero.
